## Problem-Solution Fit Analysis

| S.No | Problem Identified                      | Proposed Solution                            | How It Solves                                         | Validation Approach                                 |
|------|-----------------------------------------|----------------------------------------------|-------------------------------------------------------|-----------------------------------------------------|
| 1    | Manual data entry is slow & error-prone | Bulk import via Import Sets from Excel       | Eliminates row-by-row manual typing                   | Compare source Excel rows with target table records |
| 2    | Duplicate records created on import     | Coalesce on unique field (e.g., Employee ID) | Updates existing records instead of creating new ones | Re-run import and verify no duplicate rows exist    |
| 3    | No visibility into imported data        | Reports and dashboard on u_employee_test     | Provides visual summary of imported records           | Verify reports display correct counts and records   |
| 4    | Fields misaligned during import         | Configure explicit field mapping             | Source columns are mapped to exact target fields      | Check target records match source data attributes   |
| 5    | Data values need normalization          | Transform Map data transformation            | Transforms values during mapping                      | Inspect transformed records in target table         |

## Overall Fit Assessment

The solution directly addresses each identified problem through ServiceNow's native Import Set and Transform Map capabilities. The import pipeline eliminates manual data entry, explicit field mapping ensures accurate column-to-field alignment, coalesce prevents duplicates, and reports configured on Employee Test (u\_employee\_test) provide clear visual insights.
